

READ ME file for replication package for “The Physician-Patient Match and Health Inequality”

Ida Lykke Kristiansen and Sophie Yanying Sheng

September 23, 2025

This document provides information on how to replicate the analysis of the paper *The Physician-Patient Match and Health Inequality*. Because the data are confidential, we cannot share our data files. Instead, we provide information on how to access the data and provide all program files that generate the analysis data and the results of the paper.

The replication package consists of 45 Stata do-files and one SAS program file. Each file is described below.

1 Data

1.1 Data access

The results presented in the paper rely on a combination of several Danish administrative registers, which are merged using unique anonymous identifiers.

The use of these data is subject to the European Union’s General Data Protection Regulation (GDPR). The data are stored on secure servers at Statistics Denmark and are not allowed to be transferred to computers outside Statistics Denmark. Researchers seeking access to the register data used in this paper must submit a written application for approval by Statistics Denmark. In the case of the prescription drug register and for the General Practice Providers register, approval from the Danish Health Data Authority is also required. Access may be granted to researchers affiliated with an accredited Danish research institution, or to international researchers collaborating with accredited Danish institutions. Once approval has been obtained, the data can be accessed remotely through Statistics Denmark’s secure server. The complete list of databases required and who to contact to get access is provided in Table 1.

For more information see: <https://www.dst.dk/en/TilSalg/Forskningservice> (accessed on September 18, 2025)

In addition to the Danish administrative registers, we also use survey data developed and collected by Mette Gørtz and Miriam Gensowski. We are grateful for access to their collected data and refer researchers to contact Mette Gørtz and Miriam Gensowski for questions regarding access.

2 Software

All data preparation and analysis were performed in either SAS (version 9.4 for Windows) or Stata (version 18.0 for Windows (64-bit)).

3 Replication files

The files reproduce all tables and figures reported in the paper and appendices. The first step of the work is done in SAS, while the rest is conducted in Stata. The Stata do-file `0_all.do` runs all Stata do-files in the right order and provides a short description of each file. In addition to the files described below the do-file `z_muni_codes.do` translates municipality codes across the 2007 municipality reform. The do-file `First` sets global paths.

Table 3 provides an overview of the figures and tables in the main manuscript, along with the do-files that generate them.

Table 4 provides an overview of the figures and tables in the online appendix, along with the do-files that generate them.

3.1 Preparing the raw data files: `data_build.sas`

This SAS program prepares all raw input data for the analysis. It extracts relevant subsets from Danish administrative registers, processes them, and exports `.dta` files for use in the Stata do-file workflow. To run the file, the user has to insert the relevant paths in the code (lines 1–4). The file then performs the following 13 steps:

1. Exports provider data.
2. Constructs patient cohorts: extracts children, links parents, and identifies education outcomes.
3. Creates parental education datasets.
4. Extracts mortality data.
5. Constructs the first steps in the patient–PCP matches using claims data.
6. Constructs PCP visits/services datasets from claims, including counts of visits, services, and diabetes check-ups.
7. Exports PCP costs from claims data.
8. Creates patient background data from the population register.
9. Extracts hospital admissions and diagnoses.
10. Extracts medication use.
11. Identifies lung cancer scans.
12. Exports income data and data on labor market participation.
13. Exports PCP high school grades.

Table 2 shows an overview of the input files, a short description of each step, and where the constructed dataset is later used. Table 1 provides an overview of the registers used and the identifiers applied for merging. *pnr* is the personal identifier; *ydernr* is the PCP identifier; *recnum* is hospital admission identifier.

3.2 Patient Background Information

After exporting the relevant data using the SAS file, we construct our patient data. This is done by running the following eight do-files in Stata. The first seven files each create datasets with specific patient characteristics (1a–1j), while the final do-file `1_patient_merge.do` merges the constructed datasets into one patient dataset.

Run the following do-files in the reported order to create patient-level background variables:

`1a_children_udd.do` – Takes the full population, identifies the highest completed education, and creates a dataset with information on gender, age, mother ID, and father ID.

`1b_mortality.do` – Identifies cause of death if the individual has died.

`1c_costs.do` – Extracts PCP reimbursements.

`1e_medicine.do` – Extracts use of prescription drugs.

`1f_hospital.do` – Extracts hospital admissions.

`1g_GP_services.do` – Extracts PCP services, visits, number of visits, mean services per visit, and diabetes check-ups.

`1j_lungscans.do` – Identifies lung scans from hospital data.

`1_patient_merge.do` – Cleans and merges information about the full population, including death, hospital admissions, and prescription drug use. Combines all datasets into one file, `patient_background.dta`.

3.3 Doctor background information

The do-files 2a–2e create datasets with specific doctor characteristics, which are merged in `2_GP_merge.do`. The do-files 2e–2h create additional datasets used in the doctor–patient match (`3a_doctor_patient_match.do`) or in analyses that are not part of the main analysis. These are explained below.

The intermediate datasets often include information for the full population, but this is later merged with the PCP data.

`2a_doctor_education.do` – Creates a dataset with all doctors in Denmark.

`2b_parent_edu.do` – Identifies all mothers and fathers in the full population, merges this with information on education and age, and saves the results in separate datasets. Later, these are merged with the PCP sample.

`2c_ydernrpnr.do` – Cleans data for PCP clinics. The raw dataset includes information on all people working in private clinics; we retain only doctors in primary care clinics. The final dataset contains personal identifiers, *pnr*, for each doctor working in each primary care clinic. The PCPs' personal identifier is then used to merge additional information about each PCP.

`2d_gp_grades.do` – Extracts high school grades.

`2e_gp_ethnicity.do` – Identifies ethnic background.

`2_GP_merge.do` – Merges PCP information and constructs two datasets for later use: one at the physician level (`Yder_9518_long.dta`) and one at the clinic level, where characteristics such as social background are aggregated at the clinic \times year level (`gp_ses.dta`).

`2e_closures.do` – Identifies clinic closures based on the last date of services. The clinic closure information is used to identify doctor \times patient matches (`3a_doctor_patient_match.do`) and as a source of variation in our main analysis.

`2g_parental_illness.do` – Identifies cases of parental illness among doctors. This dataset is used in a robustness check and merged later (`7d_parental_illness.do`).

`2h_parental_income.do` – Correlates parental education with parental income and parental unemployment. Correlations are reported in Section “2.1.1 Constructing the Analysis Sample,” under the paragraph “Socio-Economic Status.”

3.4 Merge Patients and Doctors

After constructing the physician and patient datasets, we merge the two into our main analysis sample and the full population sample used for summary statistics.

`3a_doctor_patient_match.do` – Implements the Kjaergaard algorithm to match patients and doctors. Note that the initial steps of the algorithm are performed in SAS during the initial data extraction process.

`3_merge.do` – Merges the patient and doctor data. Creates both a full population dataset and the main analysis dataset.

`3c_yder_pt_ses.do` – Calculates the share of low-SES patients per PCP-year. This variable is later used in `7c_PCP_Characteristics.do`.

`3d_PostClosureSESMean.do` – Calculates the share of patients going to a low-SES PCP after a closure. Used in `8_pre_mortality_cliniclevel.do`.

3.5 Summary Statistics

These files construct the summary statistics reported either in the main manuscript or in the online appendix.

`4a_pt_sumstat.do` – Produces patient-level summary statistics (Table 1, Panel A; Table D1).

`4b_gp_sumstat.do` – Produces PCP- and clinic-level summary statistics (Table 1, Panels B–C).

`4c_test_for_selection.do` – Tests for PCP-patient selection (Table 2; Table D2).

`4d_test_for_selection_conditions.do` – Additional tests for PCP-patient selection (Table D3).

`4e_fourlineplot.do` – Plots the raw correlation between mortality and physician \times patient SES (Figure D2).

`4f_sumstat_fig_gradient_mortality.do` – Plots the mortality gradient by patient educational level and PCP social background (Figure 1).

`4g_sumstat_fig_gradients.do` – Plots health-SES gradients (Figure D1).

3.6 Main Analysis

We then run the main analysis using the following three do-files:

`5a_main_results.do` – Main DDD regressions (Tables 3, A9, D4, D5).

`5b_event_figures.do` – Event-study figures (Figures 2, 3, A1).

`5c_detection_vs_adherence.do` – Health care utilization related to chronic conditions and detection vs. adherence (Tables D6–D8).

3.7 Robustness Checks

We test the robustness of the main results in the following files:

`6a_robustness_age.do` – Expanded age range (Table A1).

`6b_robustness.do` – Additional robustness tests (Tables A2–A4, A8).

`6c_robustness_SES_missing_incl.do` – Tests for missing values in the SES definition (Table A5).

`6d_soldclinic.do` – Uses clinic sales as a source of variation (Tables A6–A7).

3.8 Mechanisms

`7a_fragile_patients.do` – Tests the fragile-patients hypothesis (Table C1).

`7b_general_concordance.do` – Provides an external validation test (Table C2).

`7c_PCP_Characteristics.do` – Tests whether other PCP characteristics explain the results (Tables D10–D11).

`7d_parental_illness.do` – Tests the parental-illness hypothesis (Table D9).

3.9 Pre-Trends in Mortality (Appendix B)

`8_pre_mortality_cliniclevel.do` – Clinic-level tests (Figure B1, Panels C–D).

`8_pre_mortality_idlevel.do` – Individual-level tests (Figure B1, Panels A–B).

3.10 Survey data

The analysis using survey data was run on a different server, since the survey data was only available there, and the main part of the paper was not included on that server. The results were generated by using the do-files from this project to create the population data with the relevant variables, and then merging it with the survey data provided, which had already been cleaned by the data providers. The main results of the paper were recreated on the server with the survey data, confirming the results can be replicated on the other server.

`9_survey.do` - Physician-patient relationship using survey data (Table 4).

Table 1: Data sources and contact

Name	Database	Years	Identifier	Contact
BEF	Befolkningen (Population Demographics)	1995-2019	pnr	Statistics Denmark
DODSAASG & DODSAARS	Dødsårsagsregistret (Cause of death registry)	1970-2019	pnr	Statistics Denmark
FAIN	Husstande og familier (Households and families)	1995-2007	pnr	Statistics Denmark
IDAP	Arbejdstilknytning (The Integrated Database for Labour Market Research)	1980-2019	pnr	Statistics Denmark
LMDB	Lægemiddeldatabasen (The Danish National Prescription Registry)	1995-2019	pnr	The Danish Health Data Authority
LPR	Landspatientregistret (The National Patient Registry)	1995-2019	pnr & recnum	Statistics Denmark
SSSY & SYSI & SYSI	Sygesikring (The National Health Insurance Service registry)	1995-2019	pnr & ydernr	Statistics Denmark
UDDA	Uddannelser (Educations)	1980-2019	pnr	Statistics Denmark
UDG	Karakterer for afsluttede uddannelser (Grades on completed educations)	1985-2019	pnr	Statistics Denmark
YDER	Yderregister (General Practice Providers)	1995-2019	pnr & ydernr	The Danish Health Data Authority

Table 2: Overview on SAS steps and input files and later use in Stata

Step	Description	SAS Input	Used Later in Stata
1. Provider data	Exports provider registers	ext.T_yder_1 ext.T_yder_person ext.Registration	1a_doctor_education.do 2a_doctor_education.do 2c_ydernrpnr.do
2. Patient cohorts	Creates dataset on children and educational outcomes	raw.Fainupdv raw.uddaupd02v	1a_children_udd.do 2a_doctor_education.do
3. parental education	Finds highest completed education of parents	raw.uddaupd02v	2b_parent_edu.do
4. Mortality	Find cause of death	raw.Dodsaasgv raw.Dodsaarsv	1b_mortality.do
5. Patient-PCP match	Constructs first steps in the patient-PCP matches	raw.Sssyupd02v raw.Sysiupdv	3a_doctor_patient_match.do
6. PCP services	Finds PCP visits, services, diabetes checks	raw.Sssyupd02v raw.Sysiupdv	1g_GP_services.do
7. PCP costs	Exports PCP costs from claims data.	raw.Sssyupd02v raw.Sysiupdv	1c_costs.do
8. Patient background	Creates patient background data	raw.Befupd01v	1_patient_merge.do 2f_ietype.do
9. Hospital admissions	Finds hospital admissions & diagnoses	raw.lpradm raw.lprdiagupdv	1f_hospital.do
10. Prescriptions	Finds prescription medicine use	lmdb.lmdbYYYY (1995-2021)	1e_medicine.do 2g_parental_illness.do
11. Lung cancer scans	Finds operation codes for lung scans	raw.Lprsksubupdv raw.lpradm	2j_lungscans.do
12. Income	Finds parental income	raw.Idapupdv raw.Indupd02v	1h_parental_income.do
13. PCP grades	Finds high school grades	raw.Udgv	1d_gp_grades.do

Table 3: List of output from the main paper and the do-files creating the output

Output	Title	do-file
Figure 1	One-Year Mortality by Patient Education and Physician SES	4f_sumstat_fig_gradient_mortality.do
Figure 2	The Effect of Physician-Patient SES Concordance on Mortality	5b_event_figures.do
Figure 3	The Effect of Physician-Patient SES Concordance on Health Behaviors	5b_event_figures.do
